Nonnegative Matrix And Tensor Factorizations: Applications To Exploratory Multi-way Data Analysis And Blind Source Separation

Synopsis

This book provides a broad survey of models and efficient algorithms for Nonnegative Matrix Factorization (NMF). This includes NMF's various extensions and modifications, especially Nonnegative Tensor Factorizations (NTF) and Nonnegative Tucker Decompositions (NTD). NMF/NTF and their extensions are increasingly used as tools in signal and image processing, and data analysis, having garnered interest due to their capability to provide new insights and relevant information about the complex latent relationships in experimental data sets. It is suggested that NMF can provide meaningful components with physical interpretations; for example, in bioinformatics, NMF and its extensions have been successfully applied to gene expression, sequence analysis, the functional characterization of genes, clustering and text mining. As such, the authors focus on the algorithms that are most useful in practice, looking at the fastest, most robust, and suitable for large-scale models. Key features: Acts as a single source reference guide to NMF, collating information that is widely dispersed in current literature, including the authors' own recently developed techniques in the subject area. Uses generalized cost functions such as Bregman, Alpha and Beta divergences, to present practical implementations of several types of robust algorithms, in particular Multiplicative, Alternating Least Squares, Projected Gradient and Quasi Newton algorithms. Provides a comparative analysis of the different methods in order to identify approximation error and complexity. Includes pseudo codes and optimized MATLAB source codes for almost all algorithms presented in the book. The increasing interest in nonnegative matrix and tensor factorizations, as well as decompositions and sparse representation of data, will ensure that this book is essential reading for engineers, scientists, researchers, industry practitioners and graduate students across signal and image processing; neuroscience; data mining and data analysis; computer science; bioinformatics; speech processing; biomedical engineering; and multimedia.

Book Information

Hardcover: 500 pages

Publisher: Wiley; 1 edition (October 12, 2009)

Language: English

ISBN-10: 0470746661

ISBN-13: 978-0470746660

Product Dimensions: 6.8 x 1.2 x 9.9 inches

Shipping Weight: 2.8 pounds (View shipping rates and policies)

Average Customer Review: 5.0 out of 5 stars [See all reviews](#) (3 customer reviews)

Best Sellers Rank: #1,166,628 in Books (See Top 100 in Books) #238 in [Books > Science & Math > Physics > Waves & Wave Mechanics](#) #3917 in [Books > Textbooks > Computer Science > Programming Languages](#) #15112 in [Books > Computers & Technology > Programming](#)

Customer Reviews

This book has a useful collection of examples of non-negative matrix factorizations. The code is included and there is considerable variety in the demonstration of each technique. My only problem with the text is it seems a little inconsistent in some places, and assumes almost immediate familiarity with the trade offs of each algorithmic implementation. However, this is a great book, when read along with an introduction to matrix factorization methods.

Best one on this subject. I was looking for a text on this matter while developing a library of biclustering mechanism. Book starts with the basics and quickly develops into the more practical aspect of blind source separation algorithms. I don't think there is nothing complaint much except for one little thing. I wish the authors accompanied some more hands-on examples and solutions instead of pseudocode.

Comprehensive reference. The best exposition I have seen. A must have. The presentation is concise, thorough, and easy to follow. Read it cover to cover, I could not put this book down.
